

First, we are going to use maps, atlases, globes to locate countries and describe their features and what clothing they might wear and why the climate will affect this.

Next, we will develop and use a criteria based upon seasons to design clothing products that are usable and for a particular audience.

Then, we will select the correct tools and equipment to make the clothing accurately.

Next, we will be able to evaluate existing clothing products as well as our own and do this against a criteria.

We will then produce sketches of humans considering the shapes required for the clothing designed.

Then, we will make prototypes of our clothing and decide which is the best and why.

Does what we wear matter?

We will then make our final design using cutting, shaping, joining and finishing

Our outcome
Lastly, we are going to showcase our clothing to an audience.
